Build Brief: "Sky Barrage" — a new Smart Motion game

What I need you to do

Add a new game called **Sky Barrage** to the existing **Smart Motion dashboard** you've already built in this session.

- Use the **Smart Motion branding you've already been given**: same colours, fonts, logo, button styles, corner radius, spacing and tone. Don't invent a new brand. New colours (sky, clouds, explosions, enemy tiers) should be tints or shades of the existing palette.
- It must **open from the dashboard** the same way the existing games/tiles do, with a clear way back.
- Before writing code, **look at how the dashboard is currently built** (file structure, how tiles/games are registered, routing, shared header/settings, storage). Follow those conventions and don't restructure what's already there.

The inspiration (don't copy it)

It's inspired by a mobile game called *Brick Out*. These are the parts of it I like:

- **Hand-designed levels** ("Level 41"). Before you play, a popup shows a **mini preview of the layout** with a big PLAY button.
- A grid of numbered tiles (20 / 30 / 50 hits) arranged in shapes such as pillars, gaps and channels. **Tile colour shows how tough it is** (teal for low HP, blue for medium, purple for high), and tiles **glow brighter as they get damaged**.
- A launcher at the bottom with a **ball count shown as "50+30"** (base balls + bonus balls). You drag to aim along a **dotted guide line** and release to fire a fast stream of balls that ricochet everywhere.
- **Indestructible metal bars** that balls bounce off, and **"Shutter" blocks** that open and close every turn (an intro tooltip explains the new mechanic the first time it appears).
- **Floating damage/score numbers** pop out of destroyed tiles, pixel-burst explosions, and a big **score counter at the top with a 3-star progress bar**.
- **Pre-level boosters** in a row of 4 slots: green ball, fire ball, split/star balls and +5

balls.

- An **in-game power-up tray** at the bottom (hammer, split, lightning, shift/move, target), each showing a count such as "x5".
- During a shot: a **FREE "drop all balls"** button (recall) and an **undo-last-shot** button that costs gems.
- A top bar with a help "?" button, a skins/palette button and a pause button.

Sky Barrage should keep that **feel and structure** but turn everything into a **planes/aviation** theme with its own art, names and twists, so it's clearly a different game.

Theme translation (ball game → Sky Barrage)

Brick Out	Sky Barrage
Ball launcher	**Carrier deck / launch catapult** at the bottom
Balls (50+30)	**Squadron of jets** ("✈ 50+30": base jets + wingmen)
Numbered bricks	**Enemy craft & cargo**: blimps, cargo crates, storm clouds, bombers, each with HP
Metal bars	**Radar towers / steel hangar beams** (indestructible, planes bounce off)
Shutter block	**Hangar Doors**: open one turn, closed the next (closed = solid)
Fire ball	**Afterburner jets** that pierce and leave a flame trail
Split/star balls	**Cluster flares**: each jet splits into 3 on its first hit
Green ball	**Stealth jet** that passes through metal/towers once
+5 balls	**+5 Wingmen**
Hammer	**Airstrike**: tap one enemy to destroy it
Split	**Formation split**: next volley fires in a V of 2 angles
Lightning	**Thunderstorm**: zaps every enemy in a random row for 50% HP
Move/shift	**Crosswind**: pushes the whole grid sideways one column
Target	**Laser sight**: aim guide shows 3 bounces instead of 1

Gems	**Medals** (soft currency)

Core gameplay

1. **Level-based**, with at least **20 hand-made levels** stored as simple data (a 7-column grid plus a list of cells: type and HP). Later levels mix pillars, channels, gaps, towers and hangar doors, as in the reference layouts.
2. **Level select / map** shows unlocked levels with stars earned. Tapping a level opens the **preview popup** (mini grid render, 4 booster slots, big PLAY button in the brand's primary button style).
3. **Aim:** drag anywhere, show a dotted flight path to the first bounce (3 bounces with Laser sight), and release to launch. Limit the angle to 10°–170°.
4. **Launch:** jets leave in a stream about 50ms apart, rotate to face their direction of travel, and leave a short contrail. **The first jet to return sets the launch point for the next shot.**
5. **Hits:** each contact removes 1 HP. At 0 the enemy bursts (pixel/debris particles, floating score number, light screen shake).
6. **Shots:** each level gives a **fixed number of turns**. After each turn the grid **moves down one row**. If an enemy reaches the deck line, or you run out of turns before clearing the grid, the level fails.
7. **Score and stars:** score goes up per HP removed plus bonuses for destroying an enemy. A **3-star bar** sits under the score at the top. Clearing the level gives at least 1 star, and score thresholds give 2 and 3 stars.
8. **During a shot:** a **"Recall" (free)** button lands all jets instantly, and an **"Undo shot"** button costs medals. Turns over about 8 seconds gradually speed up.
9. **New mechanic tooltips:** the first time a new block type appears, dim the board and show a short tooltip card (e.g. "**Hangar Doors** open and close every turn!") with "Tap to continue".

Enemy / block types

- **Blimp:** standard enemy, rounded capsule shape.
- **Cargo Crate:** square, higher HP, and drops a medal when destroyed.
- **Storm Cloud:** when destroyed, chain lightning does 1 damage to its neighbours.
- **Armoured Airship:** takes half damage (from mid-game onwards).
- **Bomber:** if it survives a turn, pushes the enemy in front of it down an extra row.
- **Radar Tower / Hangar Beam:** indestructible and solid.

- **Hangar Doors:** toggle solid/open each turn, with a short open/close animation.
- **+1 Wingman ring:** fly through it to add a jet for the rest of the level.
- **Boss Zeppelin** on every 10th level: 3 cells wide, with its own health bar.

HP number centred in the brand font; colour tier by HP using palette shades; brighter glow as HP drops.

Screens

1. **Title:** game name, Smart Motion styling, Play, best stats, back to dashboard.
2. **Level map / select** with stars.
3. **Level preview popup** with boosters and PLAY.
4. **In-game:** top bar (help, skins, level number, score with 3-star bar, pause), playfield, launcher with "✈ 50+30", power-up tray with counts at the bottom.
5. **Pause:** resume, restart, level map, dashboard.
6. **Level complete:** stars animate in, score, medals earned, next level.
7. **Level failed:** retry, or "+5 turns" for medals.
8. **Skins** (optional): jet colour skins bought with medals.

Technical requirements

- Mobile-first, built for **iPhone portrait**. Respect safe areas, touch controls first, mouse works too.
- HTML `<canvas>` with `requestAnimationFrame`, smooth 60fps with 150+ jets in flight. Use object pooling for jets and particles.
- Fixed logical grid of 7 columns × about 11 rows that scales to the screen.
- Circle vs rounded-rectangle collision with sub-stepping so jets never tunnel through anything at speed.
- Save progress (unlocked levels, stars, best scores, medals, power-up counts, skins) using whatever storage the dashboard already uses. If that's localStorage, wrap it in try/catch.
- No outside game libraries unless the dashboard already uses one. Make the jets, clouds and blimps with canvas/SVG, not copied artwork.
- Add a **new tile on the Smart Motion dashboard**, styled like the existing ones, with a small jet icon.

When you're done

- **List the files you added or changed.**
- **Give me a quick list of controls and features to test.**
- **Tell me anything in the dashboard's setup that made you deviate from this brief.**
